

## Supplier's Information

Our suppliers must respect environmental laws, regulations and directives, namely, waste management, liquid effluent treatment, prevention of soil or water contamination, prevention of air pollutants and noise emissions to the exterior. Other environmental indicators may be evaluated in due course.

Our suppliers must also ensure that the raw materials or subsidiaries used by them do not come from the illegal exploitation of resources, ensuring the sustainability of existing resources.

We evaluate our suppliers' performance by classifying their service (problems with service provided and/or technical support) and their product quality (product defects and delays in order delivery), including, as a criterion, compliance with the environmental protection rules, arising from legislation or regulations applicable to their activities, as well as those integrated into our environmental policy.

We value suppliers who adopt good environmental practices in their activities and/or have opted to implement Environmental Management Systems.

We disclose our company's environmental policy to all suppliers, we control their compliance with the activities that are carried out in our facilities and we try to condition to the extent of our influence, those that are executed in our supplier's facilities.

We ask our suppliers that carry out services in our facilities, to respect existing environmental rules and to control their application, namely:

- Reduction vs reuse of cardboard and plastic used in their product supplies.
- Waste management produced during work execution, which is the supplier's responsibility.
- All waste produced, must be properly packaged to prevent the risk of soil and/or water contamination.
- All waste should be forwarded to licensed and authorized waste management operators.
